## Test coverage

### 1.1 Coverage

Test coverage is calculated as the fraction of functions which are called from test routines. This percentage is calculated by the tool *hpc* with a call to

```
cabal new-test
```

Add to a local `cabal.project.local` file these lines:

```
tests:          True
coverage:       True
library-coverage: True
```

## Testing

### 2.1 Test main entry point

```
module Main
(
    main
) where
import Test.Tasty
import qualified Cardano.BM.Test.Aggregated (tests)
import qualified Cardano.BM.Test.STM (tests)
import qualified Cardano.BM.Test.Trace (tests)
import qualified Cardano.BM.Test.Configuration (tests)
main :: IO ()
main = defaultMain tests
tests :: TestTree

    , Cardano.BM.Test ◦ STM.tests
    , Cardano.BM.Test ◦ Trace.tests
    , Cardano.BM.Test ◦ Configuration.tests
    ]
```

#### 2.1.1 instance Arbitrary Aggregated

We define an instance of *Arbitrary* for an *Aggregated* which lets *QuickCheck* generate arbitrary instances of *Aggregated*. For this an arbitrary list of *Integer* is generated and this list is aggregated into a structure of *Aggregated*.

```
instance Arbitrary Aggregated where
    arbitrary = do
        vs' ← arbitrary :: Gen [Integer]
        let vs = 42 : 17 : vs'
        (m,s) = updateMeanVar $ map fromInteger vs
```

```

return $ AggregatedStats (Stats
  (PureI (last vs))
  (PureI (minimum vs))
  (PureI (maximum vs))
  (toInteger $ length vs)
  (m)
  (s)
)

```

Estimators for mean and variance must be updated the same way as in the code.

```

updateMeanVar :: [Double] → (Double, Double)
updateMeanVar [] = (0, 0)
updateMeanVar (val : vals) = updateMeanVar' (val, 0) 1 vals
where
  updateMeanVar' (m, s) _ [] = (m, s)
  updateMeanVar' (m, s) cnt (a : r) =
    let delta = a - m
        newcount = cnt + 1
        m' = m + (delta / newcount)
        s' = s + (delta * (a - m'))
    in
      updateMeanVar' (m', s') newcount r

```

### Control tracing in a hierarchy of *Traces*

We can lay out traces in a hierarchical manner, that the children forward traced items to the parent *Trace*. A *NoTrace* introduced in this hierarchy will cut off a branch from messaging to the root.

```

### Change a trace's minimum severity

A trace is configured with a minimum severity and filters out messages that are labelled with a lower severity. This minimum severity of the current trace can be changed.
